Infiniti Code Technologies - Onboarding Portal

Production Deployment Guide (Supabase + Cloudflare + Render)

1. Architecture Overview

- Database: Managed PostgreSQL on Supabase for relational employee records.
- Storage: Private Supabase Storage bucket (onboarding-docs) for documents.
- Backend API: Express / Node.js service hosted on Render PaaS.
- Frontend: Vite + React SPA served via Cloudflare Workers.
- Domain: onboarding.infiniticodetech.com pointed via CNAME on Wix DNS.

2. Step 1: Set up Supabase Project

1. Go to supabase.com and create a new project named infiniti-onboarding.
2. Save the database password securely.
3. Copy the Connection Pooling PostgreSQL URI from Settings -> Database.
   postgresql://postgres:[PASSWORD]@db.[PROJECT-REF].supabase.co:5432/postgres?sslmode=require
4. In Storage -> Buckets -> Create new private bucket named: onboarding-docs
5. In Project Settings -> API -> copy Project URL and service_role secret key.

3. Step 2: Configure Environment Variables

In server/.env configure the following keys:

```
PORT=4000
DATABASE_URL="postgresql://postgres:[PASSWORD]@db.[REF].supabase.co:5432/postgres?sslmode=require"
JWT_SECRET="[long-random-secret-generated-by-openssl-rand-hex-32]"
ADMIN_EMAIL="admin@infiniticodetech.com"
ADMIN_PASSWORD="[Minimum 12 character strong password]"
CLIENT_ORIGIN="https://onboarding.infiniticodetech.com"
COOKIE_SECURE=true
SUPABASE_URL="https://[PROJECT-REF].supabase.co"
SUPABASE_SERVICE_ROLE_KEY="[service_role_secret_key]"
```

4. Step 3: Run Prisma Migrations and Seed

From the project root on your machine, initialize the Supabase schema:

```
cd server
npx prisma migrate dev --name init
npm run seed
```

This creates the User, EmployeeProfile, Document, and Invitation tables in Supabase.

5. Step 4: Deploy the Backend API to Render

1. Push this repository to GitHub.
2. On render.com, click New + -> Web Service and select your repo.
3. Set Root Directory to: server
4. Set Build Command to: npm install && npx prisma generate
5. Set Start Command to: npx prisma migrate deploy && node src/index.js
6. Add the environment variables from server/.env into the Render dashboard.
7. Deploy the service and copy your public HTTPS URL (e.g. https://api.onrender.com).

6. Step 5: Configure Cloudflare Worker Proxy

Update worker/index.js to proxy /api/* to your Render backend URL.

In wrangler.jsonc, set vars.BACKEND_URL to your Render URL.

Run the deployment commands:

```
npx wrangler login
npm run build
npm run deploy
```

7. Step 6: Connect Domain in Wix DNS

1. In Cloudflare Worker -> Settings -> Domains -> add onboarding.infiniticodetech.com
2. In Wix DNS Manager, add a CNAME record with host "onboarding" pointing to Cloudflare.
3. Do not modify the existing root @ or www records on Wix.
